

## Access Your Inbox While On The Go

Since e-communication has become a crucial part of business relationships, a large number of enterprises are using Microsoft Exchange Server believed to be the world's most frequently used business messaging software intended to make e-mailing quicker and more efficient.

One of the principal features of Microsoft Exchange Server is a high level of security shielding employees' e-mail boxes from Internet threats, such as hackers, viruses, and spam. It also secures e-mail confidentiality, which allows the personnel of a company to use the e-mail system fully.

Corporations deploying Microsoft Exchange Server thus enable their employees to access their email boxes from any place in the world. Wherever employees are, they can access all crucial papers and can reply to important e-letters as quickly as possible. The email software used by Microsoft Exchange Server is Microsoft Office Outlook which has many different features intended to make e-communication and contact management easier and hassle-free. Some of the options which can be used with Microsoft Office Outlook and Microsoft Exchange Server include calendar options, programming options, voice mail storage and contact management programs.

Microsoft® closely cooperates with BlackBerry® which develops the most thorough end-to-end wireless solutions for business environments.

BlackBerry® and largely its product - BlackBerry Enterprise Server (BES) - are very popular among handheld owners. By using BES, companies' employees can access e-mail boxes, data stores and applications right from their mobile professionals.

A purpose-built push technology is used in BlackBerry Enterprise Server which automatically routes the whole e-mail message to the user's BlackBerry mobile professional without the user's confirmation for that. Along with wireless email reconciliation, read/unread status, deletions and filing can be synchronized wirelessly between the user's handheld and their PC.

BES is a suitable tool for business people enabling them to keep in contact with business partners and solve urgent business issues while on-the-go.

## About the Author

Microsoft [Hosting Exchange Server](#) has been introduced to optimize business e-mailing management. [BES](#) tool closely integrates with Microsoft [Exchange Server](#) and provides wireless e-communication from any corner of the world.
