

Internet Home Based Business - What's the Best Internet Service Provider?

There are several different types of internet service providers out there currently. You may think that the major variation amongst the service providers is just the speed of the connection. In truth, that is only one factor that can affect the overall service from the service provider. Some of the characteristics that make one provider different from another are speed of connection, availability of service, ability to connect, cost, technical knowledge, service hours and quality of the equipment. When you have an internet home based business you should consider all the factors in order to determine the best possible selection.

Dial Up

The oldest and probably most common internet service provider is still the dial up service. This is accomplished by dialing through your computer modem into the server computer with a telephone access. This is a more common solution for an internet home based business because telephone lines are still available in most areas of the country. Using dial up involves either purchasing a second telephone line or transferring the cord from the telephone jack to the computer. The difficulty with dial up is the limited number of access points at the service provider's location. If all the lines are busy, the internet cannot be accessed until someone else quits using the internet.

Cable

In more populated areas, where there is already cable television available. Those with an internet home based business can use the cable company in order to access the internet. The speeds for the cable hookup is certainly faster than the dial up service and more dependable since there is a higher usage factor and the service is often better maintained. The equipment tends to be more up to date. If you already have cable television, cable internet service is probably a good option for you. It's fast, convenient and the price is reasonable.

Wireless

A wireless connection for your internet home based business is even faster than the other two. The problem is the availability and access issues. You have to be in a wireless hot spot and have the proper equipment in order to use the service. Because of the line of sight requirements for the internet connection to work properly, finding a good location to operate your internet connection may prove to be difficult or impossible. Use of wireless service is totally dependent upon location and availability of nearby receiving and transmitting stations.

Satellite

A satellite access for your internet home based business is certainly an excellent way to get service even to a fairly remote location. Any place in the United States that has an unobstructed view of the southern sky can get internet access. Other than the expected satellite lag time which occurs, upload speeds and download speeds are very fast. One difficulty with a satellite internet system is that the equipment can be quite expensive, depending on whether you purchase or lease it. Some issues have arisen with the volume of usage by some clients. Some internet service providers limit the amount of bandwidth that can be used in any particular time period.
