

## Why do you need a Data Recovery Tool?

Huge companies around the world have lost expensive information due to corrupt hard drives, viruses and Trojans, and due to those circumstances these companies have lost huge amounts of money – and a few of them watched as their businesses came plummeting to the ground for something as small and fragile as a hard drive.

You can use data recovery software to recover information from your local hard drive, your extra hard drive, a floppy disk, a removable or portable hard drive, memory cards, and in most cases you could even use it to recover information from old CD's. In addition a hard drive crash is no match for data recovery software. The other great thing is that you will be able to recover basically every piece of information that was on your hard drive like your email messages, video files, music and photos and obviously your data files and documents.

There are many different data recovery software programs you can use to recover your files; some of them even let you browse through your deleted files to see what you would like to retrieve. There are processes that can recover and restore your deleted files in seconds! Once the data has been recovered from your hard drive you have the option to either save it to another folder on a different hard drive or storage device, or you can burn it directly to CD. Once your files have been successfully recovered by the data recovery software, all your information stays the same, which is to say that nothing will have been changed, even in the event of a virus overload, the file names and all the data will still be intact.

Another important feature of data recovery software is that you can select the full system scan and choose which files you would like to recover after the scan is complete, and you can choose to save it to a removable drive or you could choose to burn it straight to CD, remember that most data recovery software programs do not allow you to save information on the same drive you have recovered it from, as there is always a possibility of the same problem occurring.
