

Ultimate Samsung Watch Mobile

Dubbed a 'watch phone', the dual-band GSM 900/1800 MHz device will offer one and a half hours of continuous talk time and 80 hours of stand-by time at the flick of a wrist. The handset also supports voice activated dialling and includes a built-in phone book and 40 different polyphonic ring tones, and weighs in at under 80 grams.

Measuring a minute 37.8 x 64 x 17.7 mm, the watch phone also offers support for GPRS Class 10, which should provide users with more than comfortable speed when using its WAP 1.2 browser and e-mail client. In addition, the watch phone also supports SMS and MMS, as well as Bluetooth and speakerphone capabilities. Whether the Bluetooth support also includes a DUN Profile is unknown, but it would be fair to assume that if it did, the watch phone would quickly become a hot item amongst owners of Bluetooth-enabled PDAs seeking GSM/GPRS connectivity.

[Samsung-Watch-Phone](#) is showing off the world's smallest GSM/GPRS mobile phone, which just so happens to be fitted to a watchband. The tiny phone features a 96x64 256-color OLED screen, a phone book, WAP 1.2, Bluetooth, voice-activation, 40 polyphonic ringtones, and a speakerphone.

Despite being a first-generation watch phone, Samsung's new Dick Tracy-style watch offers a range of advanced features. Users will interface with the watch phone through its 8-bit (256 colours) OLED display, sporting a resolution of 96 x 64 pixels which can be personalized by means of wallpapers. Also, as befits a watch phone, the display shows the time when the user is not engaged in other activities. Once again proving its technical prowess, Samsung will ship the world's first wrist watch style mobile phone, boasting GSM/GPRS, an 8-bit colour display and more in Q4.
