

## Regain Internet Privacy from Spyware

The majority of computers connected to the internet today are infected with some sort of spyware. The prevalence of internet use has made the growth of spybot, adware, spyware, Trojans, keyloggers and other malware fast and easy.

Each form of surveillance software invades users' privacy through numerous methods so they can gather information about people's internet and computer activities. Users must learn to deny spyware access or remove any current infestations in order to maintain a private internet experience.

The consequences of spyware can include identity theft, loss of system control, PC slow downs, pop up ads and browsers crashes. Without a spyware removal tool you are continuing to invite spyware in to invade your privacy. Your anti-virus and firewalls cannot catch most spyware applications because they are installed by piggybacking in on legitimate downloads that you approve such as freeware programs as well as music and game software.

Once on your computer the spyware works silently, beyond the user's knowledge to gather private information. Spyware and adware software are stealthily embedded in your system, making them difficult to remove manually, which is why it is vital for internet users to find a spyware scanner. Spy scan tools search through the hard drive for spyware infected files. It then removes the detected files so your computer can be restored to its normal working capabilities. Several spyware tools actively protect you from spyware infections while you are working online.
