

Get Your CCNA and Advance Your Career

Most people in the information technology field understand the importance being up to date and qualified for their position. The right education, experience, and certifications can be key to finding a job, getting a promotion or finding a new job. Having the newest certifications can help increase your salary, keep your job secure and make sure that you are staying ahead in your field. If you are interested in furthering your career, you should seriously consider getting CCNA certified.

With a CCNA (Certified Cisco Network Associate), you will stand out in the information technology field with the competence, knowledge and skills to impress any employer. An individual with a CCNA is an IT professional that is certified in Cisco products.

A CCNA certificate can help to validate a person's ability to install, configure and operate routed and switched networks. Employers are very interested in employees and potential employees having this certification. That can mean an increase in your salary or promotion, or a great resume booster when applying for a new job.

To get a CCNA, you must pass the CCNA certification program, which can be challenging and takes plenty of preparation. The standards for a CCNA are changing, and by the fall of 2007, these standards for passing the CCNA exam and receiving a CCNA will become even more difficult yet. However, the more challenging the certification, the better your resume will look for potential employers. Some of the new features to the new exam will include: rapid spanning tree protocol, switch security, router security, virtual private networks, wireless routing and more.

In order to prepare yourself for this certification and all of the benefits that come along with it, you should find a quality training program. There are many programs available that you can purchase and use to help you get prepared for the CCNA exam.

You should find a quality program that can give you the knowledge and confidence you need to pass this exam. Although there are many available, some are better than others. For working people, CCNA certification classes may not be a convenient option to prepare yourself. A better option may be to purchase a CCNA preparation guide that you can use at home. Video tutorials hosted by Cisco Network Certified professionals are a great way to learn and prepare. Other great tools to look for are lab books and CCNA practice exams.

Make sure to do some research and find a quality training program that will work for your preparation needs. The right preparation can be key to passing the CCNA exam, and once you have that certification, you can be sure that you are staying ahead in your field and on top of your career.
