

What Makes a Saturn Exceptional?

Some might think that car safety is a luxury, but it is definitely not the case with Saturn vehicles. The General Motors Corporation-produced Saturn takes pride in its good-looking vehicles that are fully equipped with Saturn parts that promote safety. These automotive parts are made from quality materials to ensure that a Saturn product can function at its best.

Since the Western automaker's debut in the automobile industry in 1985, Saturn has always placed functionality of products and safety of users as top priorities. From the vehicle's interior to the exterior, every Saturn vehicle is manufactured with only the best automotive parts. Interior [Saturn parts](#) have evolved for more efficiency, just like the vehicle's engine. Each Saturn model has an engine with a four-cam phasing made of aluminum block and cylinder heads. These types of materials give a Saturn engine minimal weight compared to other branded engines. Thus it is easier to achieve greater efficiency, balanced power, and lower emissions. A special kind of suspension system is also available in Saturn vehicles. To achieve a beefed-up suspension, the MacPherson front suspensions and independent four-link rear suspensions are utilized. The four-link rear suspensions allow each Saturn wheel to react independently to road inconsistencies especially during off-road driving. With these Saturn parts, the vehicle has greater control with minimal noise and motion. Another important part in a Saturn is the autograde braking which was developed to automatically shift the transmission into a lower gear while the brake pedal is being pressed. Moreover, the brake system of a Saturn has the four-wheel disc anti-lock brakes with Dynamic Rear Proportion. This kind of disc brakes allows the vehicle to go from 60 mph to 0 while maintaining stable steering.

The exterior Saturn Parts, on the other hand, are manufactured to endure heavy responsibilities like absorbing crash impacts. Another safety measure of the company is to equip every vehicle with a steel safety cage that forms a protective barrier around its passengers. High-steel door beams, reinforced side pillars, as well as front and rear door energy absorbing padding do the work of protecting Saturn users. Other Saturn parts like the trusty airbags, seat belts, and lighting system are also geared in all Saturn vehicles. All these exceptional parts can only give current owners and future users the peace of mind when driving a Saturn.
